```
This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have eytosteric activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legless (1gs) protein homologue lgs/bcl9 described in the
                                                      Novel polypeptide useful in therapeutic method for treating disorders of cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human BCL9 homologue, SEQ ID NO:2178.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABB10981-ABB12330 represent nucleic acids encoding them. The curvention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides of the invention, methods of producing the nucleotides or polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable Miological activities, and hence to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable Miological activities, and hence of infertual therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activity; activity, tissue growth activity; or cell differentiation activity; activity; tissue growth activity; or may be mutomodulatory activity; tissue growth activity; or chemotractic or chemokranetic activities; hadmostatic, thrombockic or thrombolytic activities; activities; polypeptides and nuclecides of the invention are useful for perventing, treating or ameliorating medical convolved in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, haemacopoietic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haemacopoietic disorders (e.g., myeloid or lymphoid cell vaccular growth. Polypeptides involved with tissue regeneration and capairs prover. Polypeptides involved with tissue regeneration and tengal infections in addition to immune disorders to becterial and fungal infections in addition to immune disorders to becterial and fungal infections in addition to immune disorders or actidental damage. The polypeptides and nucleotides and nucleotides or actidental damage. The polypeptides and nucleot or sugment or replace cells damage or activities or any absorbers and activit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   239 TIVSFHIQNISNNKTERSTAPLNTQISALRNDPKPLPQQPPAPANQDQNSSQNTRLQPTP 298

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA00010-AA013910) that exhibit activity elating to grotkine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

                                                              The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear localised protein #2.

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous and central nervous system diseases, such as Alzheimer's Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       53 ОЅСРКР-РІРРРРРООООООРРРОООРРРООРРИОРРИРОРИООООРРРРОООЅЅКРVV 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 TIVSFHIONISNNKTERSTAPLNTOISALRNDPKPLPQOPPARANODONSSONTRLOPTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     33; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence mouse beta-catenin nuclear localised protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ch 22.6%; Score 232.5; DB 23; Length 1494; I Similarity 35.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     55 RLOPTPP ----- IPAPAPKPAAPPRPLDRESPGVENKLIPSVGSPA-SSTPLPPDG 104
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for identifying modulators of actin polymerisation. The method involves using proceins that contain at least one binding motif for proteins of the Enal VASP (vasodilator-stimulated phosphoprotein) family in the preparation of reagents for identification/screening of molecules that modulate formation of the actin cytoskeleton. The proteins used in the method (i.e. the proteins with binding motif(s) for Ena/VASP proteins) do not bind to the Arp2/3 protein complex. The modulators identified by the method are potentially useful for treating disorders of actin polymerisation, e.g. metastatic cancer or parasitic infection, and as cytotoxic agents. The present sequence one such protein with binding motif(s) for Ena/VASP proteins, which was used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a WASP (Wiskott-Aldrich syndrome protein) homologue. Peptide fragments of WASP-family proteins of eukaryotic cells are used to prepare reagents for detecting compounds that inhibit or stimulate formation of the actin cytoskeleton, and detect and identify compounds which are potentially useful for treating particularly metastatic cancer and parasite infection, as cytotoxic agents for inhibiting/stimulating formation of actin polymerisation, as cytotoxic and for detecting side-effects, on actin polymerisation, of pharmaceuticals. By modulating actin polymerisation, of pharmaceuticals. By modulating actin polymerisation, these compounds affect cell motility, embryonic development, the immune response and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7 IONISNNKTERSTA----PLNTQISA---LRNDPKPLPQQPPAPANQDQ----NSSQNT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, conditioners, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of the identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving activity of (II) or to treat disease states involving activity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications of disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human can amino acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_esures.

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            106 PPPVKSPPPPPAVSSPPPVKS---PPPPAVSSPPPVKSPPVKSPPPAVSSPPPVKSPP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             33 PKPLPQOPPAPANQDQNSSQNTRLQPTPPIPAPA--PKPAAPPRPLDRESPGVENKLIPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neural Mena+ protein, mammalian Ena, Enabled protein, Ev1 protein, cytoskeleton, cell morphology, cell adhesion, cell differentiation, cell growth, cell motility, mouse.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel polymucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polymucleotides of the invention and antibodies encoded by the may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention.

                                                                                                                                                                                                                                                                                            This protein comprises novel murine neural Mena+. Its amino acid sequence was deduced from a CDNA clone (see AAV02998) obtained from a mouse brain cDNA ilbrary. Neural Mena+ contains an exon that introduces 244 amino acids between amino acids 238 and 239 of mammalian Ena (Mena, see AAW37124). Two other isoforms, neural mammalian Ena (Mena, see AAW37124) and neural Mena++ (see AAW37125) are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural tiscue-specific distribution. Based on the disclosed Mena and Evl genes (see also AAW37129), a cvariety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors. Crucy and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell method of detecting a modulator of Mena activity/expression is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a CDNA clone obtained from a mouse brain cDNA library. Two other isoforms, neural Mena+ (see AMW37151) and neural Mena++ (see AMW37153), are also disclosed. Unlike mammalian Ena (Mena, see AAW37148), neural Mena isoforms exhibit neural tissue-specific distribution. Based on the disclosed Mena and genes (see also AAW27148), as a see a see also AAW37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic evence involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation. A methods and modulator of Mena activity/expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of modulators of Mena and Ena-VASP-like genes and proteins - used in control of cytoskeletal dynamic events in normal and abnormal cell morphology, adhesion, motility, growth and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         88;

Its amino acid sequence was deduced from a cDNA clone obtained from a mouse brain conformer. To cDNA library. Two other isoforms, neural Mena + (see AAW37151) and neural Mena++ (see AAW37151) and conforms exhibit neural. Chan (Mena, see AAW37148), neural Mena isoforms exhibit neural. Chan (Mena, see AAW37148), neural Mena isoforms exhibit neural. Chan (Mena, see AAW37148), neural Mena isoforms exhibit neural. Chan (Mena, see AAW37148), neural Mena isoforms exhibit neural. Chan issue-specific distribution. Based on the disclosed Mena and Evl genes (see also AAW37148-49), a cariety of methods and compositions are provided for screening, variety of methods and compositions are provided for screening.

Cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                          Detection of modulators of Mena and Ena-VASP-like genes and proteins - used in control of cytoskeletal dynamic events in normal and abnormal cell morphology, adhesion, motility, growth and differentiation

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
-:- FUNCTION: Involved in signal transduction through the wnt pathway.
-:- SUBUNIT: Binds to beta-catenin (CTNNB1), PYG01 and PYG02.
-:- SUBCELPULAR LOCATION: Naclear (PYDBADE).
-:- SUBCELPULAR LOCATION: Naclear (PYDBADE).
-:- TISSUB SPECIFICITY: Detected at low levels in thymus, prostate, cestis, ovary and small intestine, and at lower levels in spleen, colon and blood.
-:- DISEASE: Involved in a t(1;14) (Q1;Q32) chromosomal translocation buckenia (ALL). This translocation leaves the coding region inteact, but may have parthogenic effects due to alterations in the expression level of BGL9. Several cases of translocations within the 3' untranslated region of BCL9 have been found in B-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDIINE-21952490; PubMed=11955446; Kramps T., Peter O., Brunner E., Nellen D., Froesch B., Chatterjee S., Murone M., Zuellig S., Basler K.; Murone M., Zuellig S., Basler K.; "Wnt/wingless signaling requires BCL9/legless-mediated recruitment of Pygopus to the nuclear beta-catenin-TCF complex."; Cell 109:47-60(2002).

-I- FUNCTION: May be involved in microfilament assembly and cell
motility. Induces the formation of F-actin rich outgrowths in
fibroblasts. Required for neurolation and commissure formation.

-I- SUBCNIT: Binds profilin.

-I- SUBCNIT: Binds profilin.

-I- SUBCNIT: Localized to focal adhesions and, to a
lesser extent, leading edges and stress fibers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Name=2; Synonyms=Mena;

1801642702-2; Sequence=Not described;
180164703 COMPOSED OF THREE DOWAINS: A MODULATING N-TERMINAL DOMAIN,
A DNA-BINDING DOWAIN AND A C-TERMINAL STERCID-BINDING DOMAIN.
SIMILARITY: Belongs to the nuclear hormone receptor family. NR2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Proc. Natl. Acad. Sci. U.S.A. 99.16899-16903 (2002).

ISSUE SPECIFICITY: Expressed only in brain (neuropil of cortex, CAL region hippocampus and molecular layer for creebellum).

DEVELOPMENTAL STAGE: Expression increases from low levels at birth to high levels at 3-4 weeks before dropping slightly in adulthood. Expressed in the cortex and the molecular layer of the cerebellum at postnatal day 7. Isoform 2 expression does not change during developmment of both cortex and cerebellum. Isoform 4 expression
                                                                                      INTERACTION WITH HOMER-1, AND SUBCELLULAR LOCATION.
